YOUR CHILD MAY NEED 2 DOSES OF FLU VACCINE

If your child is aged between 6 MONTHS AND 8 YEARS and is receiving their first flu vaccination or has previously received only 1 dose of vaccine, THEY NEED 2 DOSES OF FLU VACCINE.

HERE’S WHY:

• The first dose “primes” the body—the second dose helps protect it.¹

• In a study published in 2020, children aged 6 months to 8 years who received 2 doses of the flu vaccine were better protected compared with those who had not been fully vaccinated.²

¹Vaccination with flu vaccine may not protect all recipients.
²Study spanned from the 2014-2015 through 2017-2018 flu seasons and included 7,533 children 6 months to 8 years of age. This included children aged 6 months to 8 years with an acute respiratory tract illness with cough who presented for outpatient care within 7 days of illness onset.

NEXT STEP

THE FIRST DOSE SHOULD BE GIVEN AS SOON AS THE VACCINE BECOMES AVAILABLE.

IF 2 DOSES ARE NEEDED, SCHEDULE AN APPOINTMENT 4 OR MORE WEEKS AFTER THE FIRST DOSE.
